

# **MATH/COSC 4340**

## **Numerical Methods for Differential Equations**

Dane Taylor, School of Computing and the  
Department of Mathematics & Statistics, University of Wyoming

[dane.taylor@uwyo.edu](mailto:dane.taylor@uwyo.edu)

# Course Material Overview

1. Ordinary Differential Equations (ODEs)  
solves for a scalar function  $f(t)$  using initial condition  
or a system, or set of equations:  $x(t)$ ,  $y(t)$ ,  $z(t)$
2. Boundary Value Problems (BVPs)  
incorporates information about  $f$  at/along a boundary
3. Numerical Linear Algebra (NLA)  
efficiently solves linear systems and computes spectral  
decompositions
4. Partial Ordinary Differential Equations (PDEs)  
solves a function defined over a D-dimensional space  $f(x,t)$  or  
 $f(x,y,z,t)$

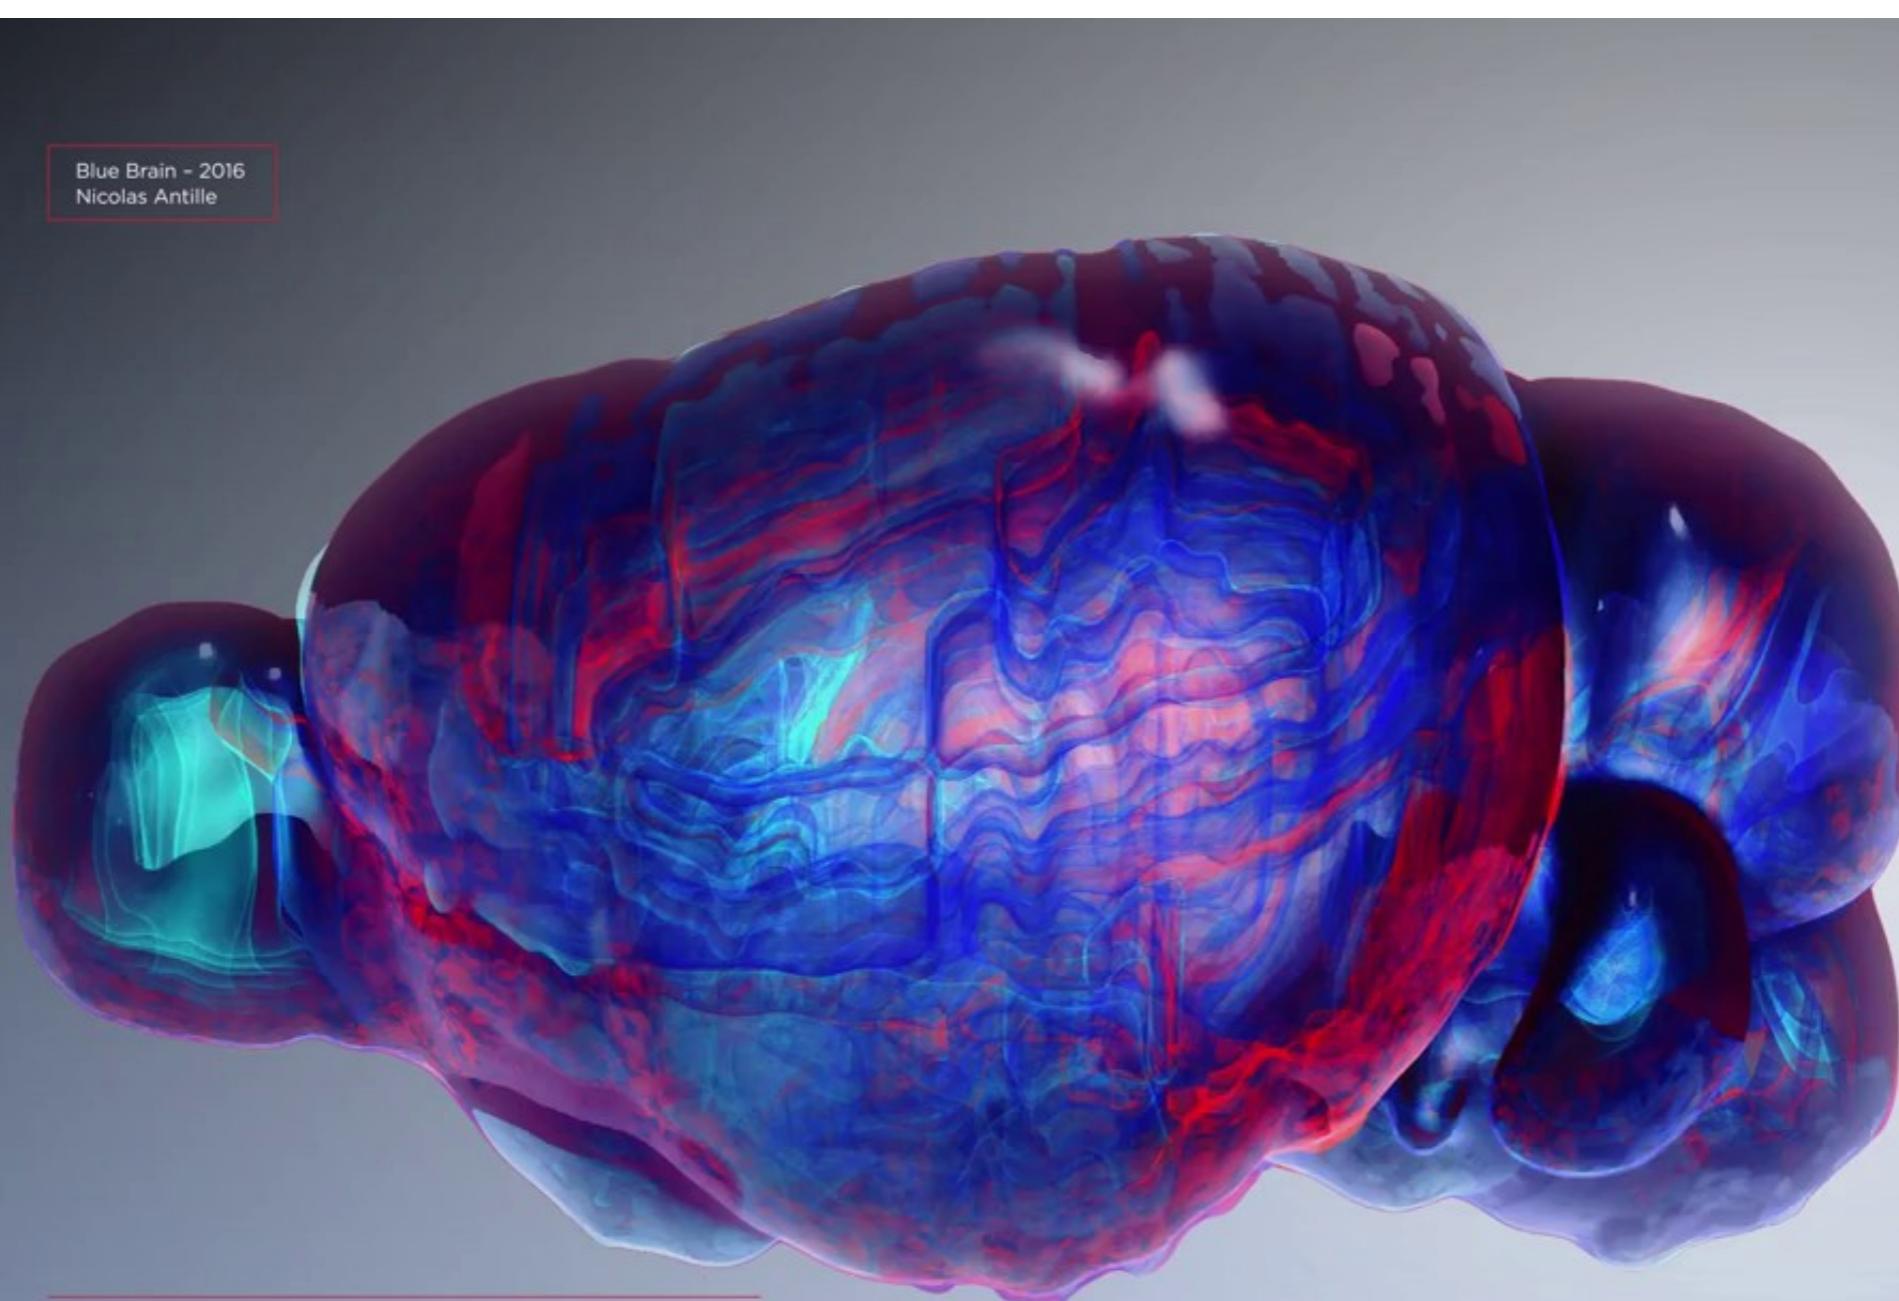

# ODE Applications: *Predict Celestial Motion*

Solar System with  
Unity Physics

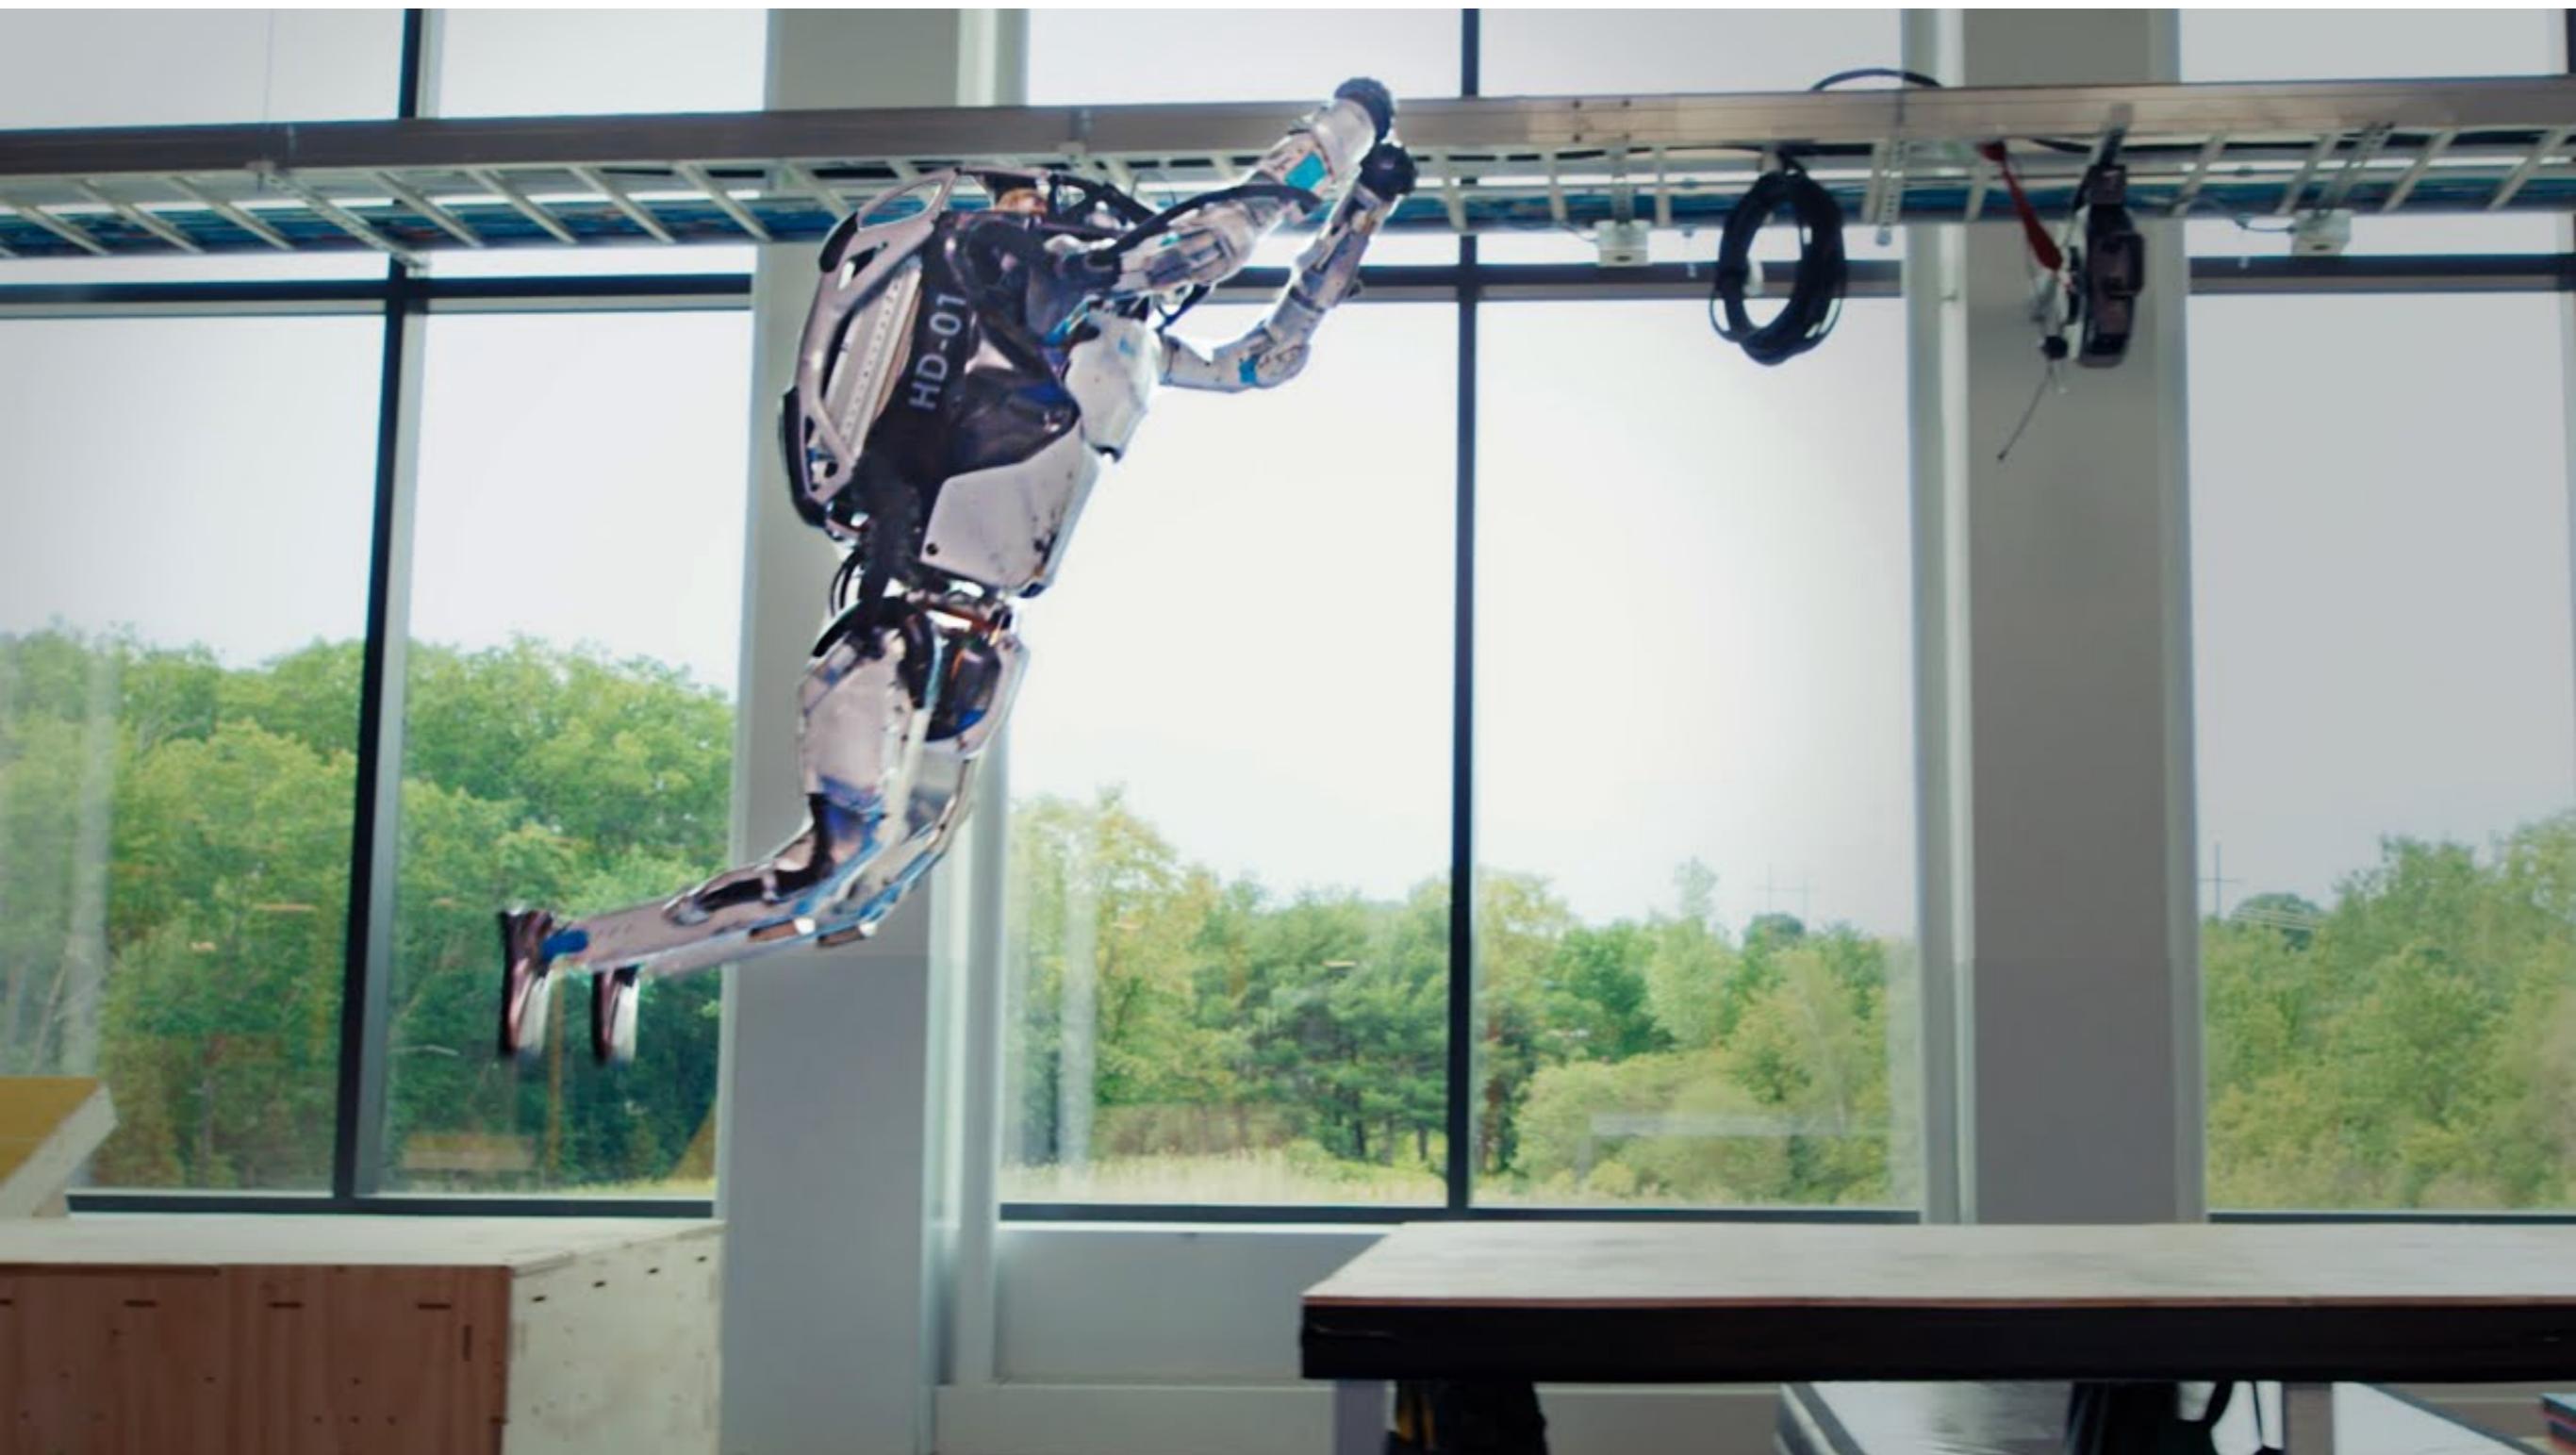

# ODE Applications: *Simulate Brain Dynamics*

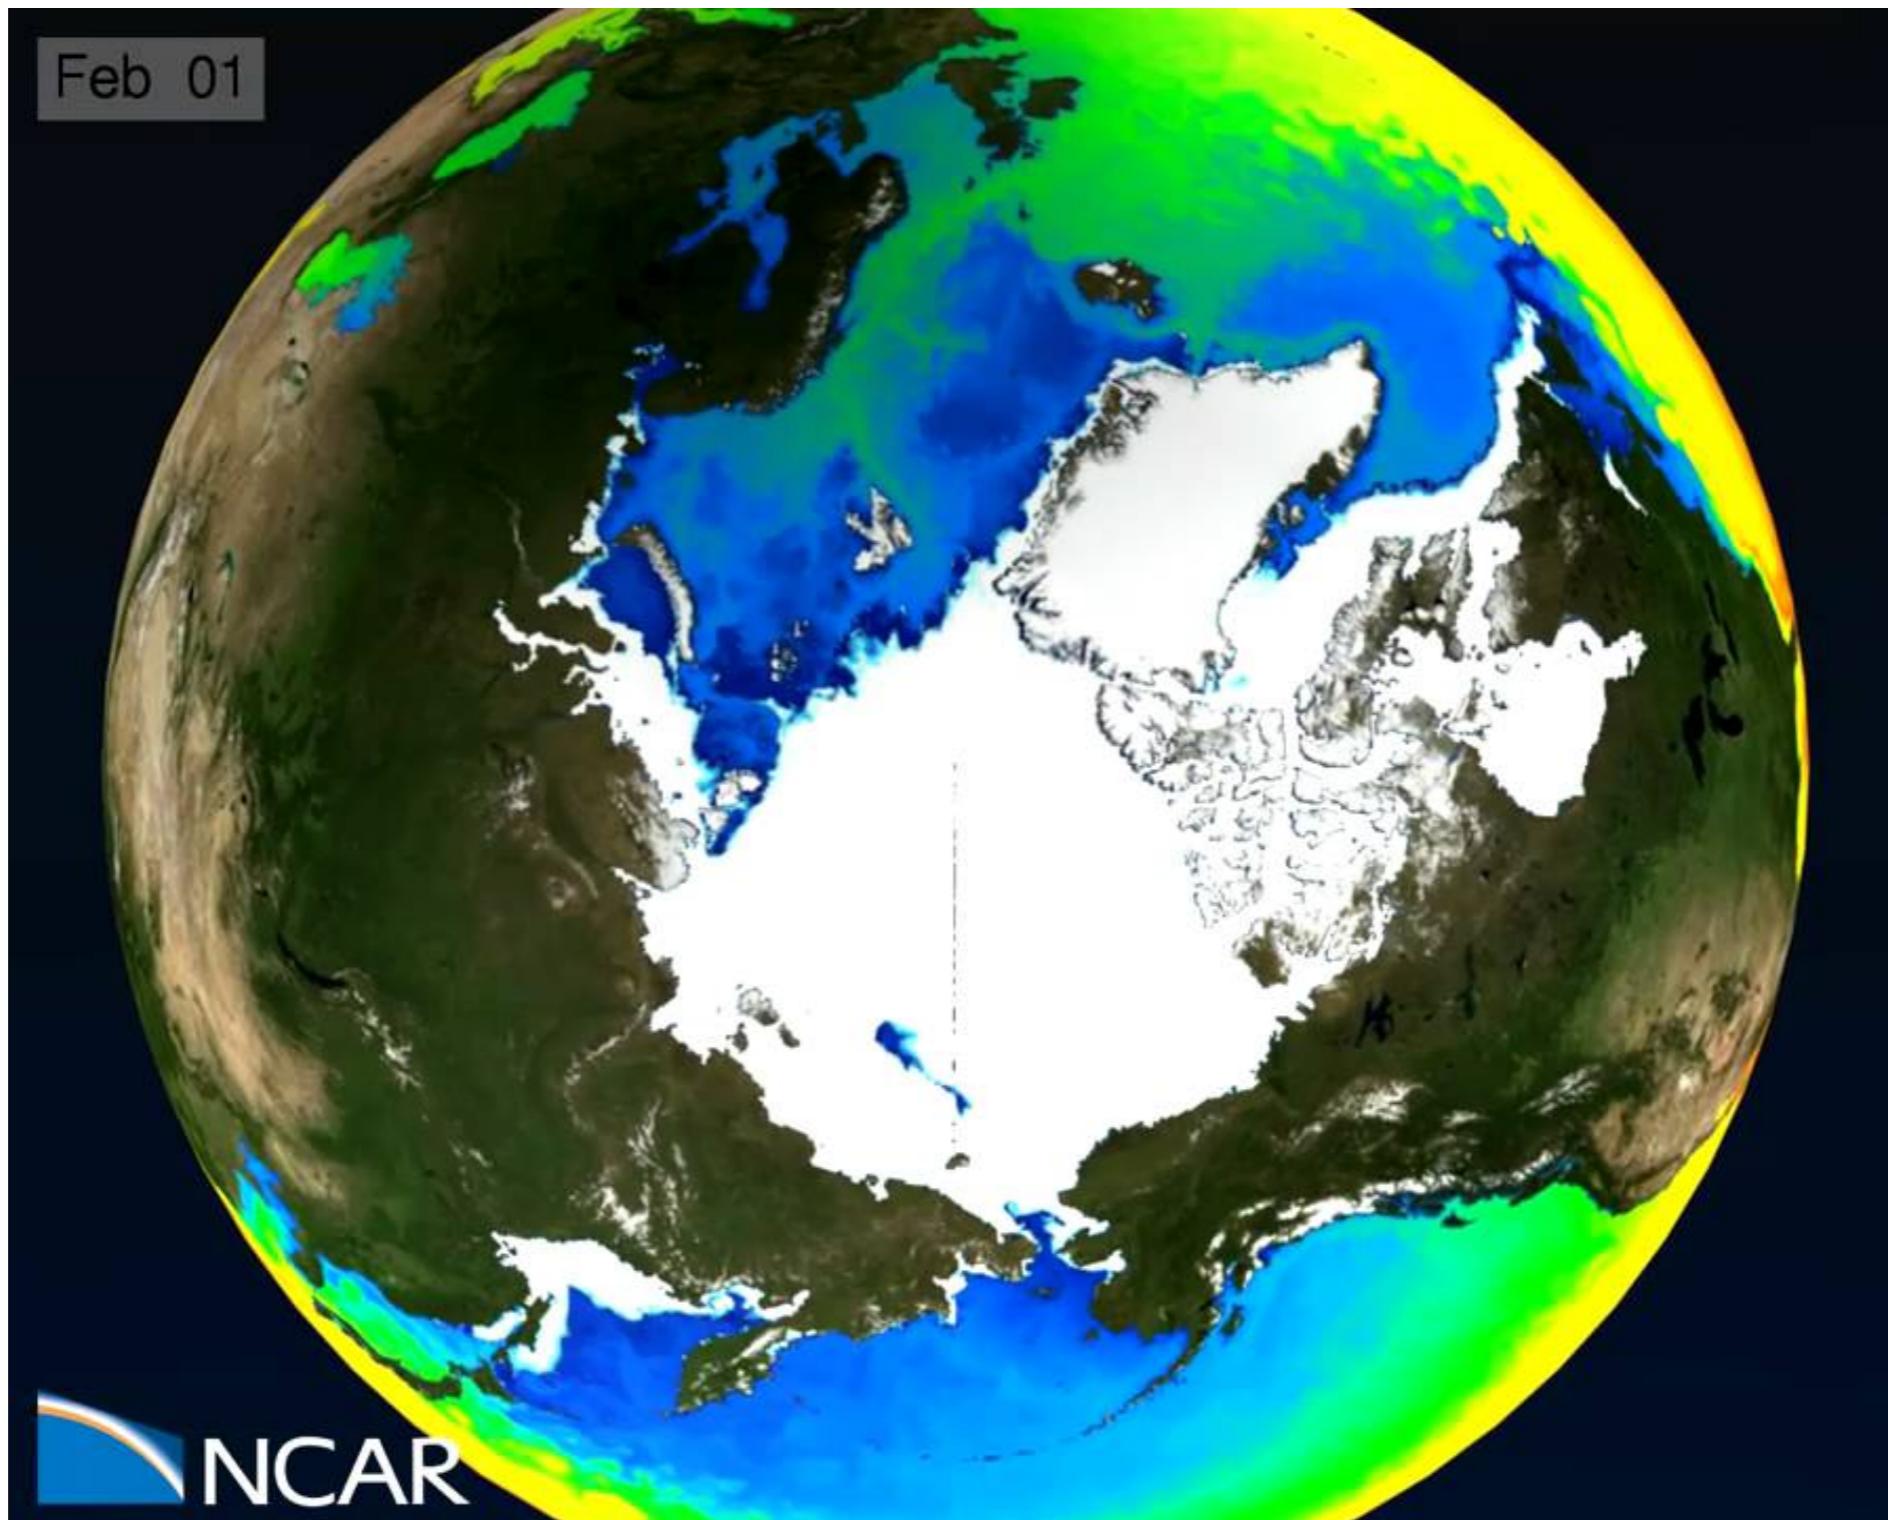

---

865 regions in the mouse brain  
from the Allen brain atlas

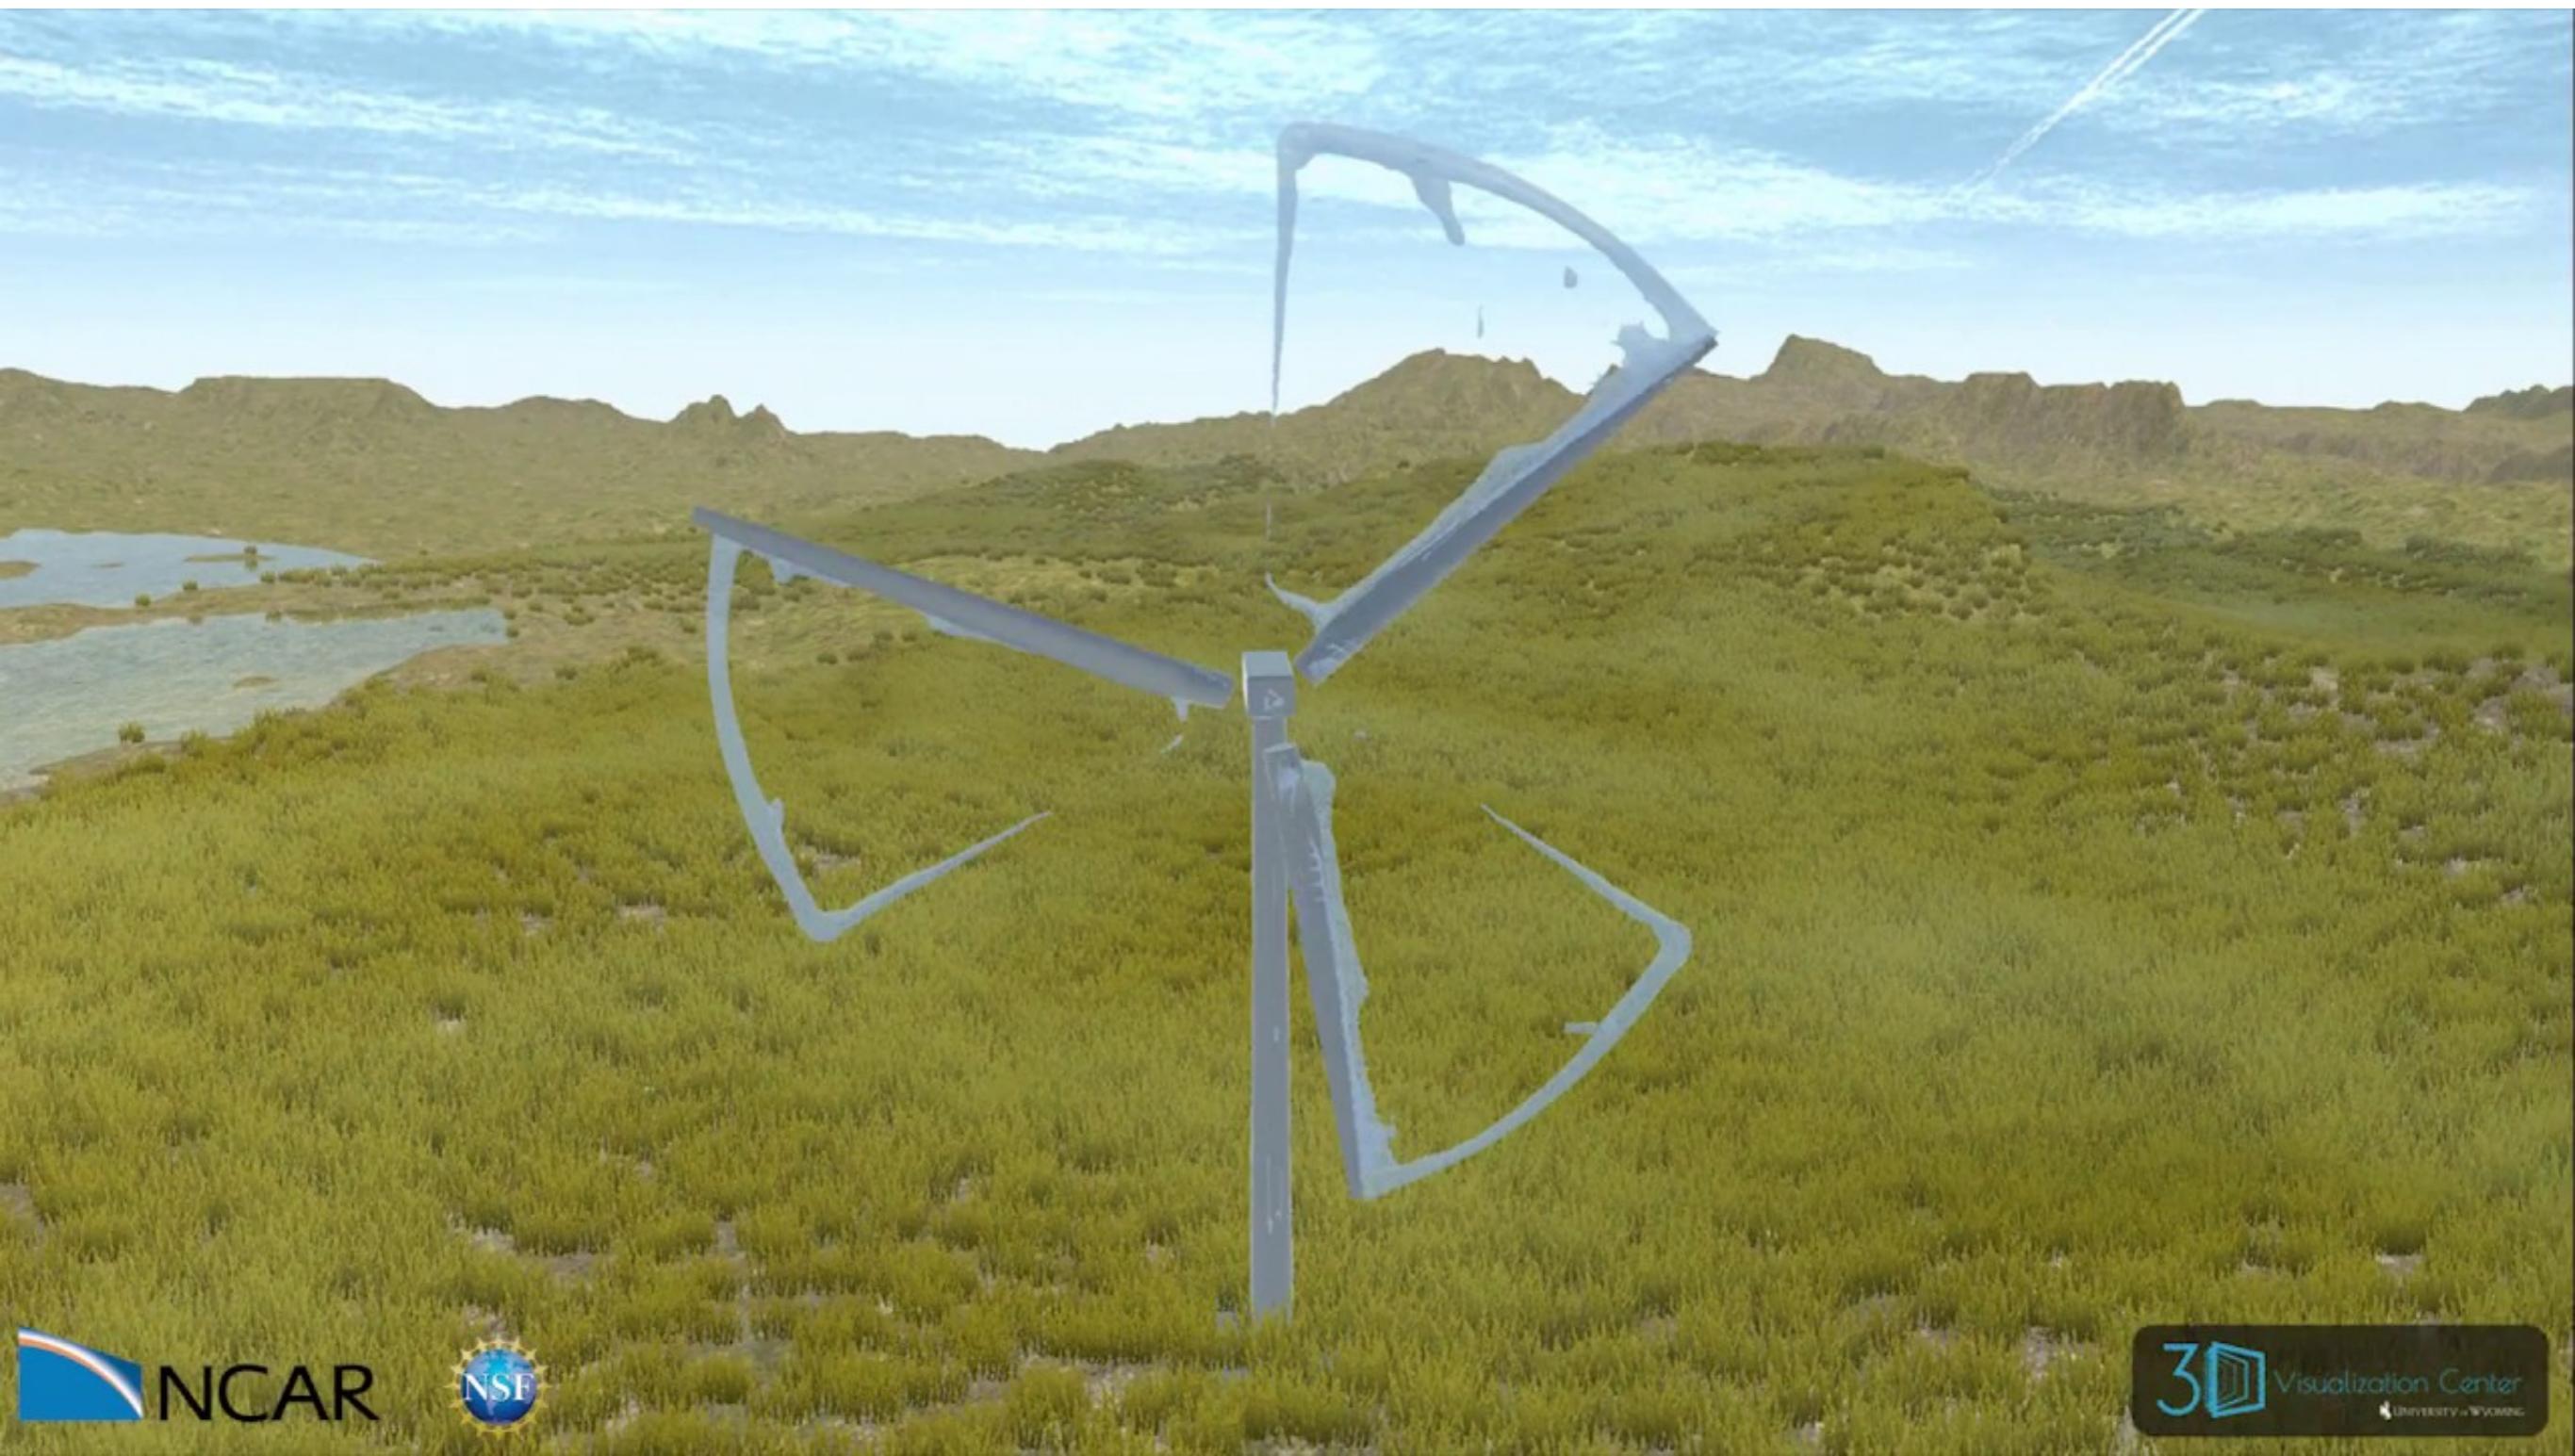

# ODE Applications: *Train/Define Robot Motions*

# PDE Applications: *Climate Simulation and Prediction*

# PDE Applications: *Simulate and Optimize Wind Farms*

# NCAR Supercomputing Facility in Cheyenne

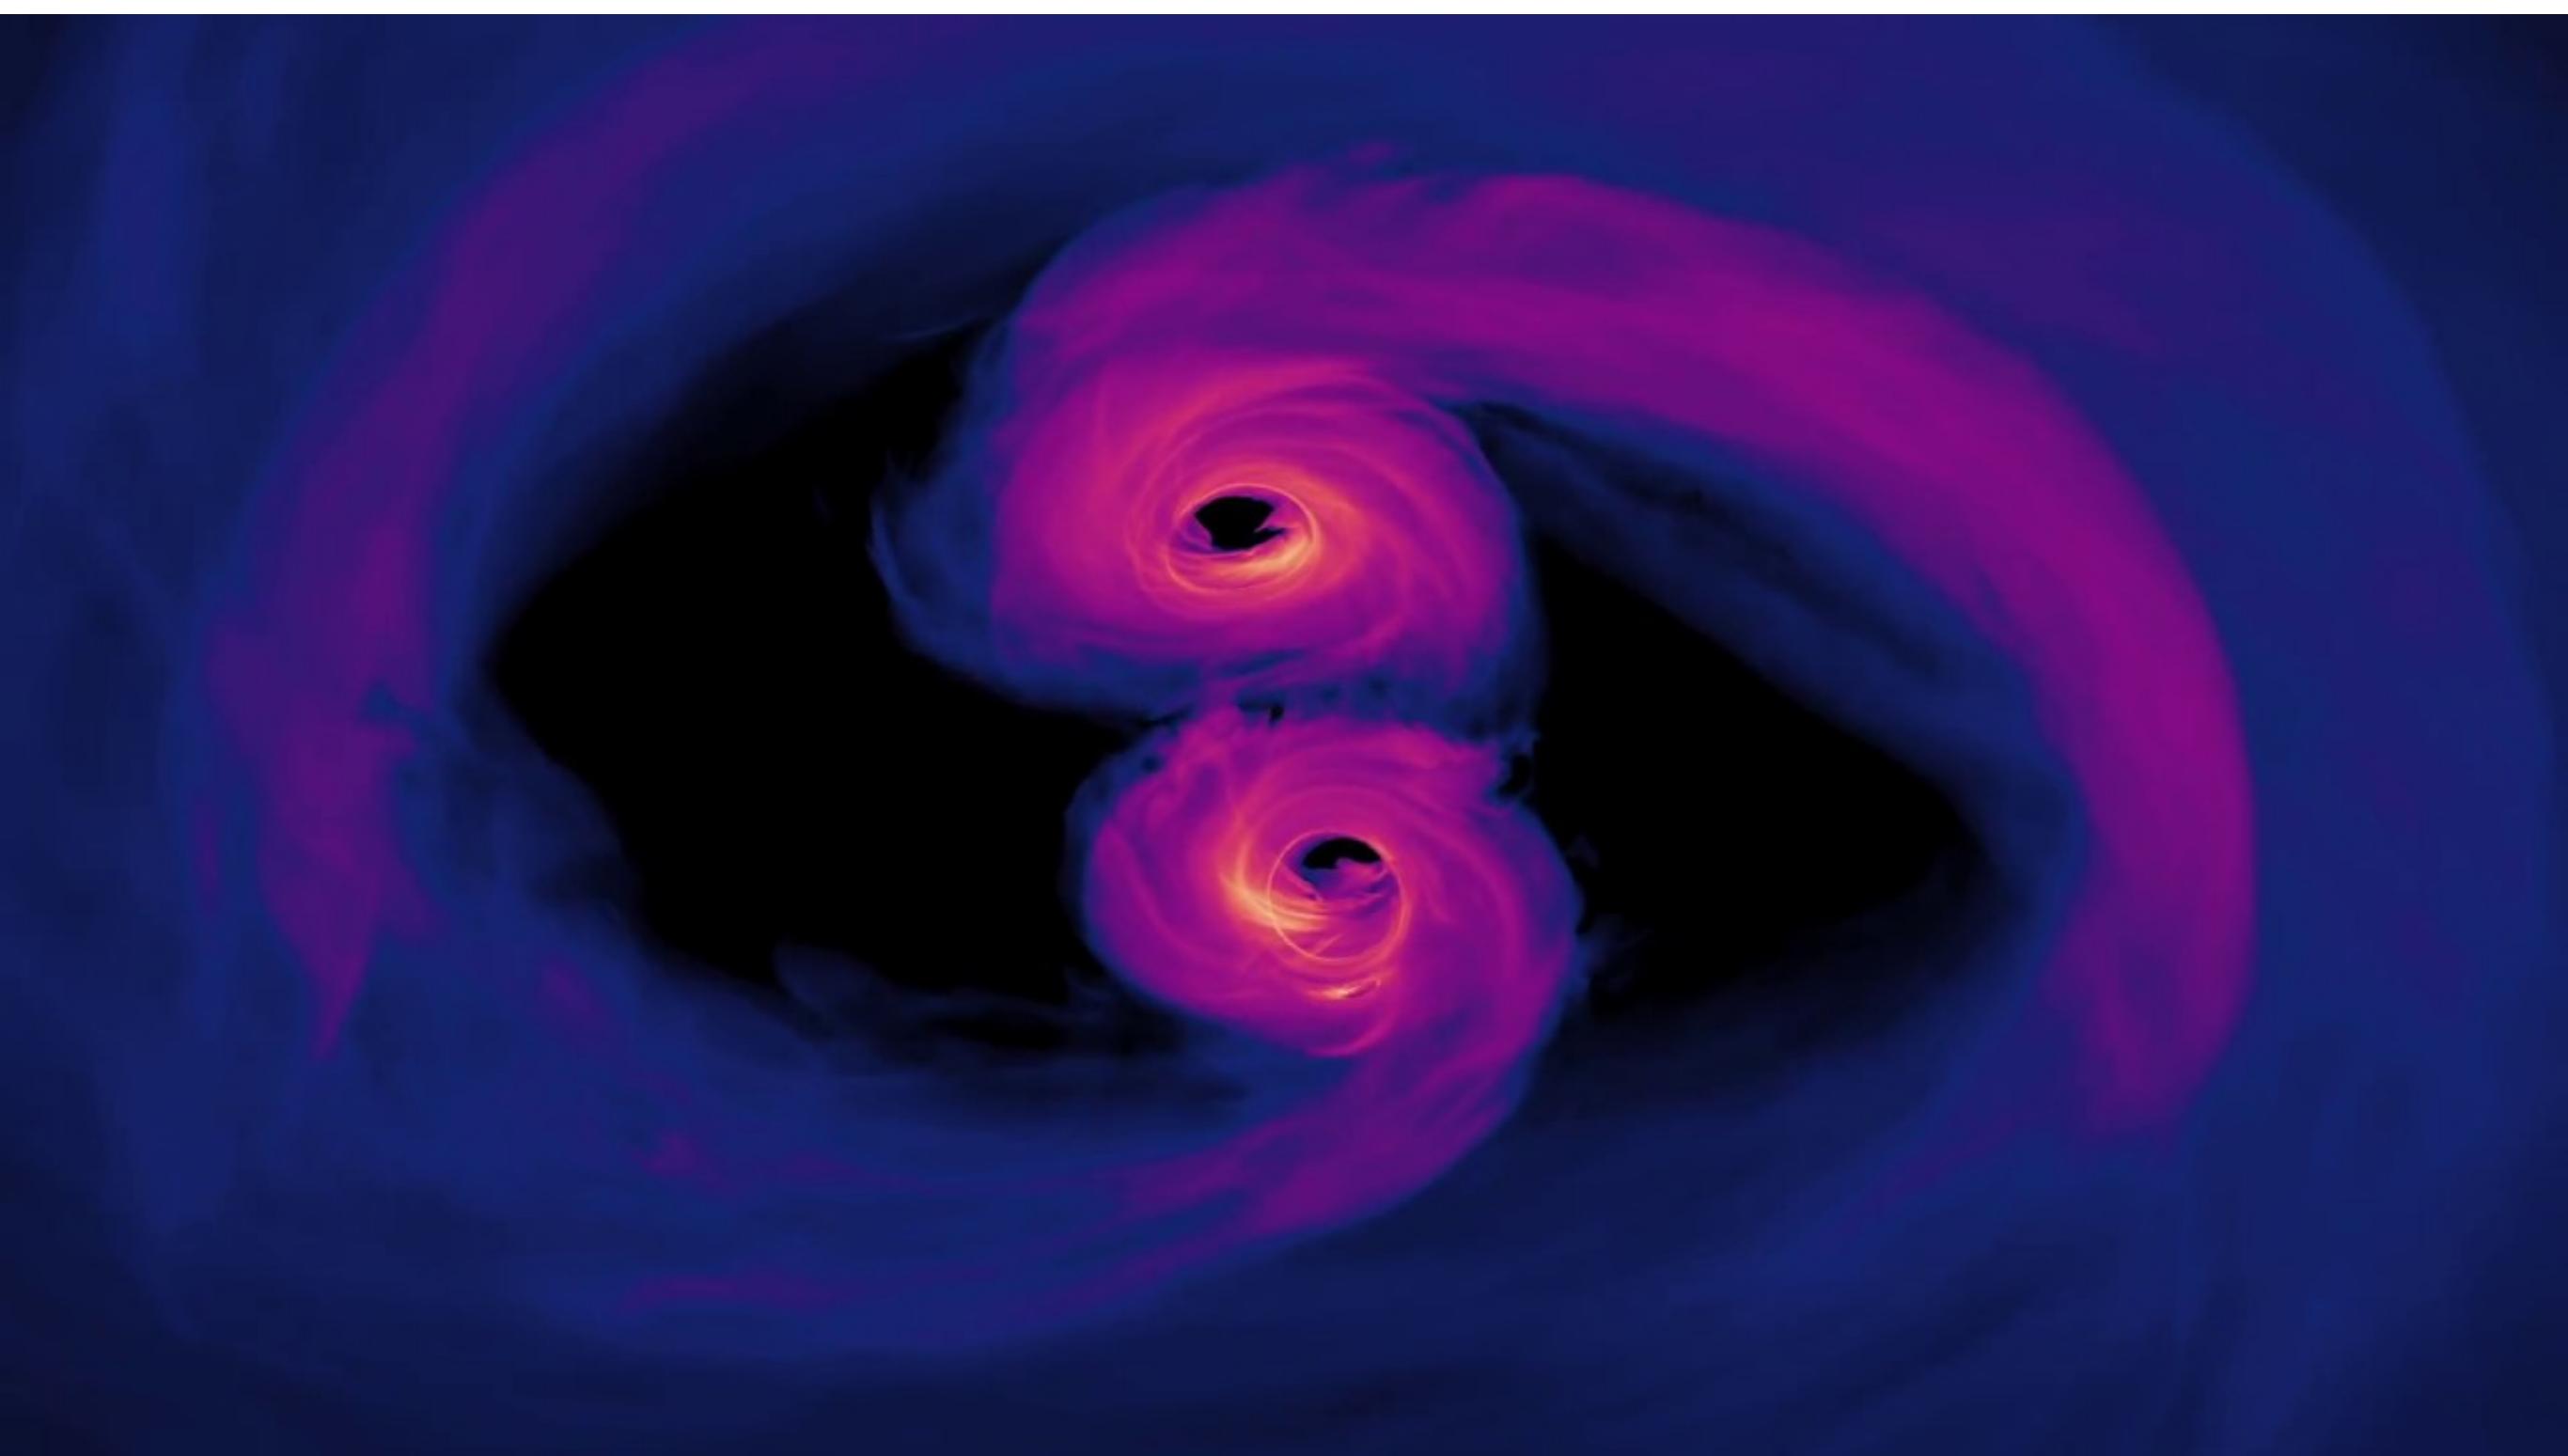

# School of Computing Opportunities for Research

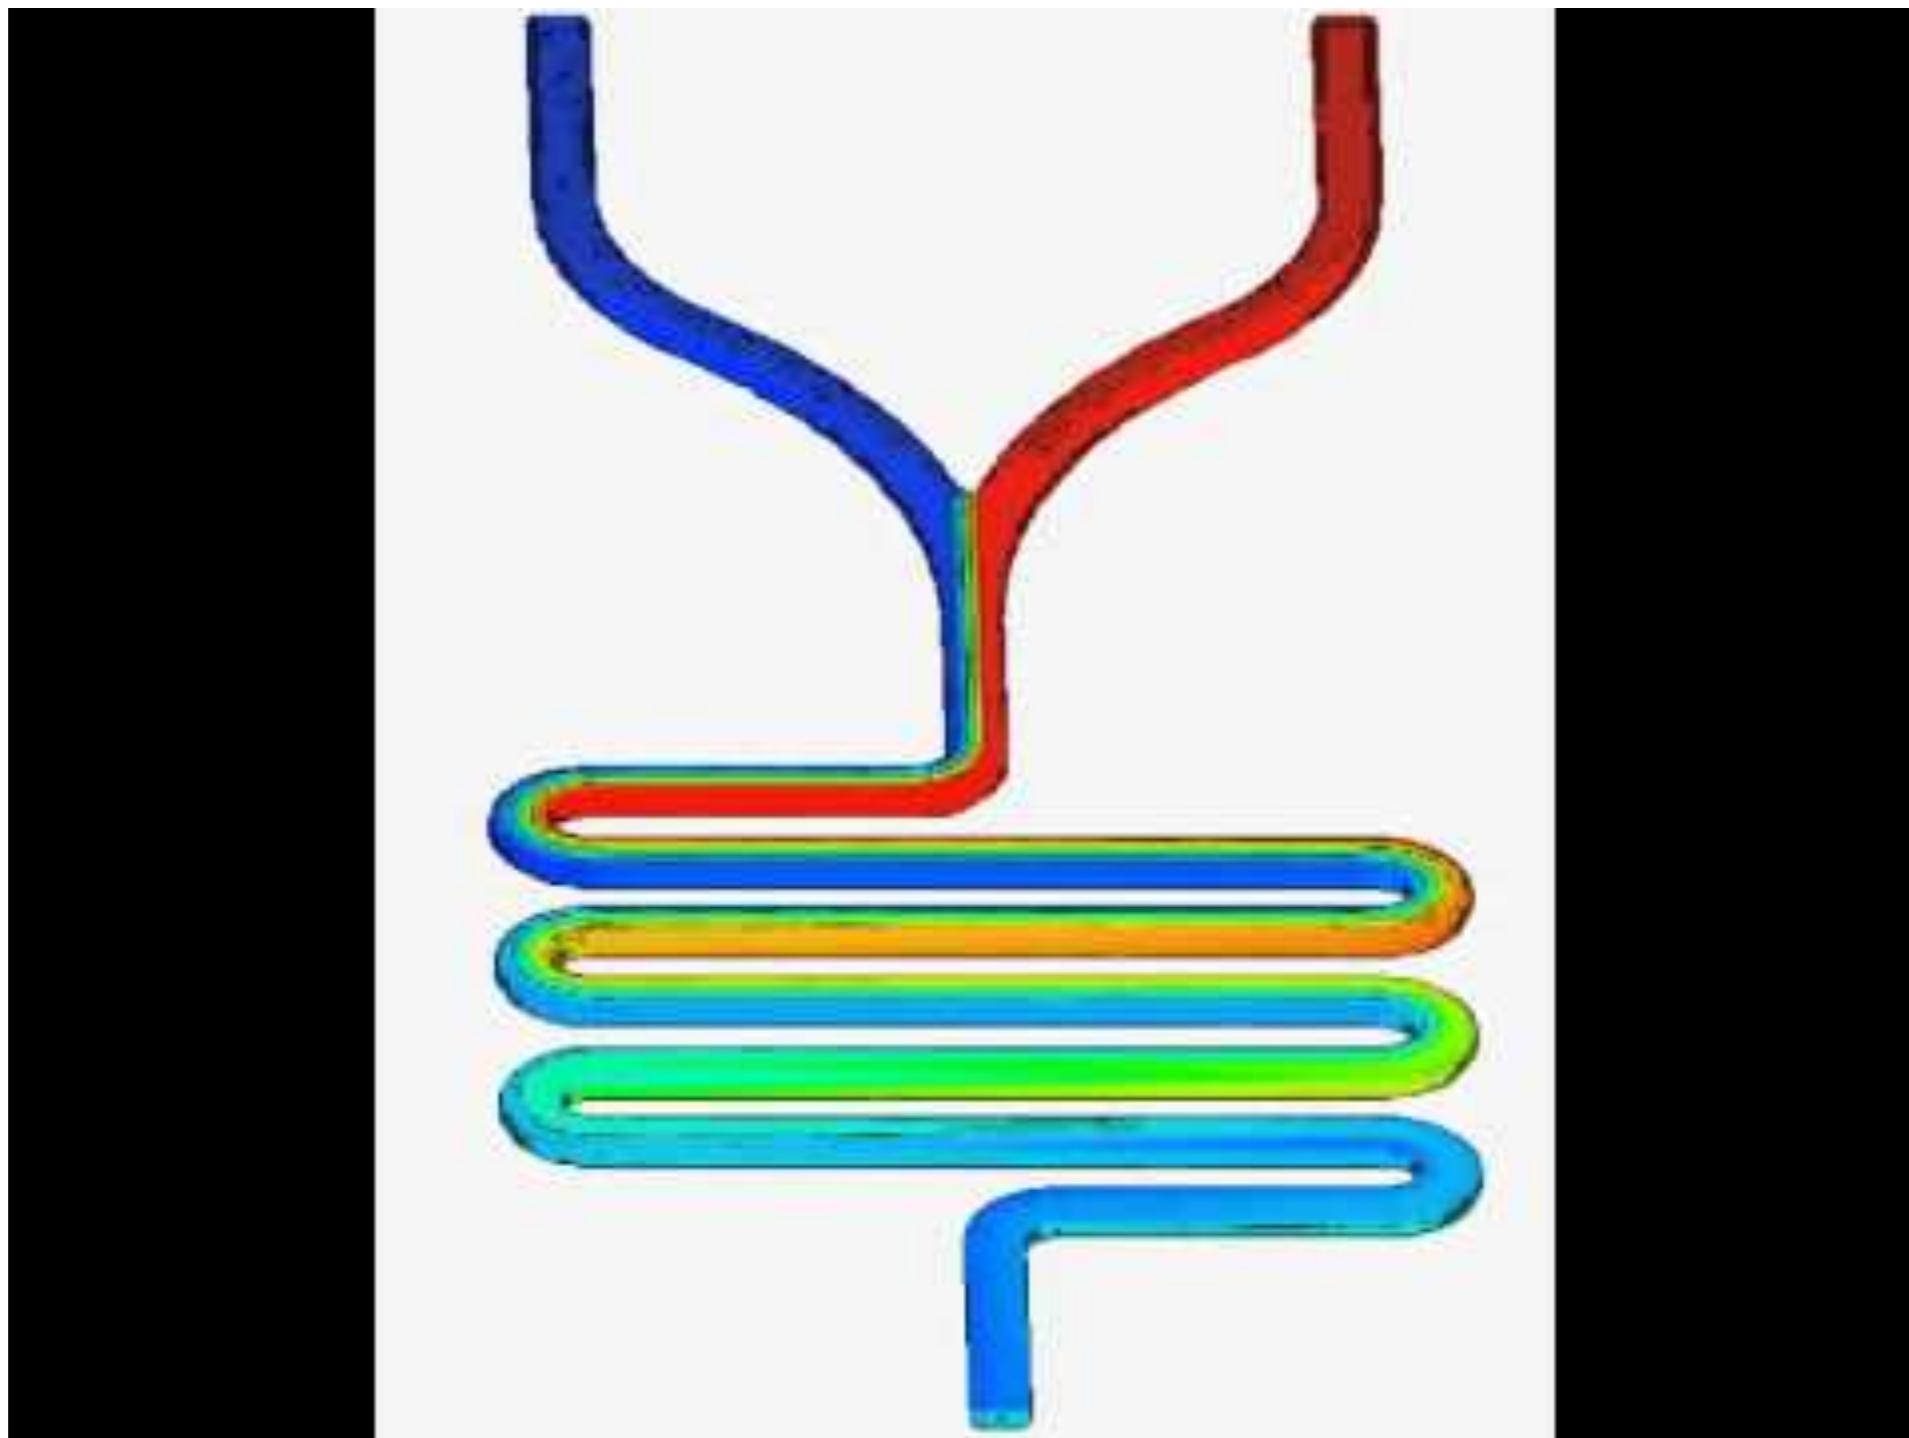

- Many researchers at UW are looking for research assistants with experience writing code in Python, including developing solutions to differential equations.
- Opportunities for paid summer internships and part-time positions during the semester.
- Email me if you are interested: [dane.taylor@uwyo.edu](mailto:dane.taylor@uwyo.edu)

# PDE Applications: *Simulate Black Holes*

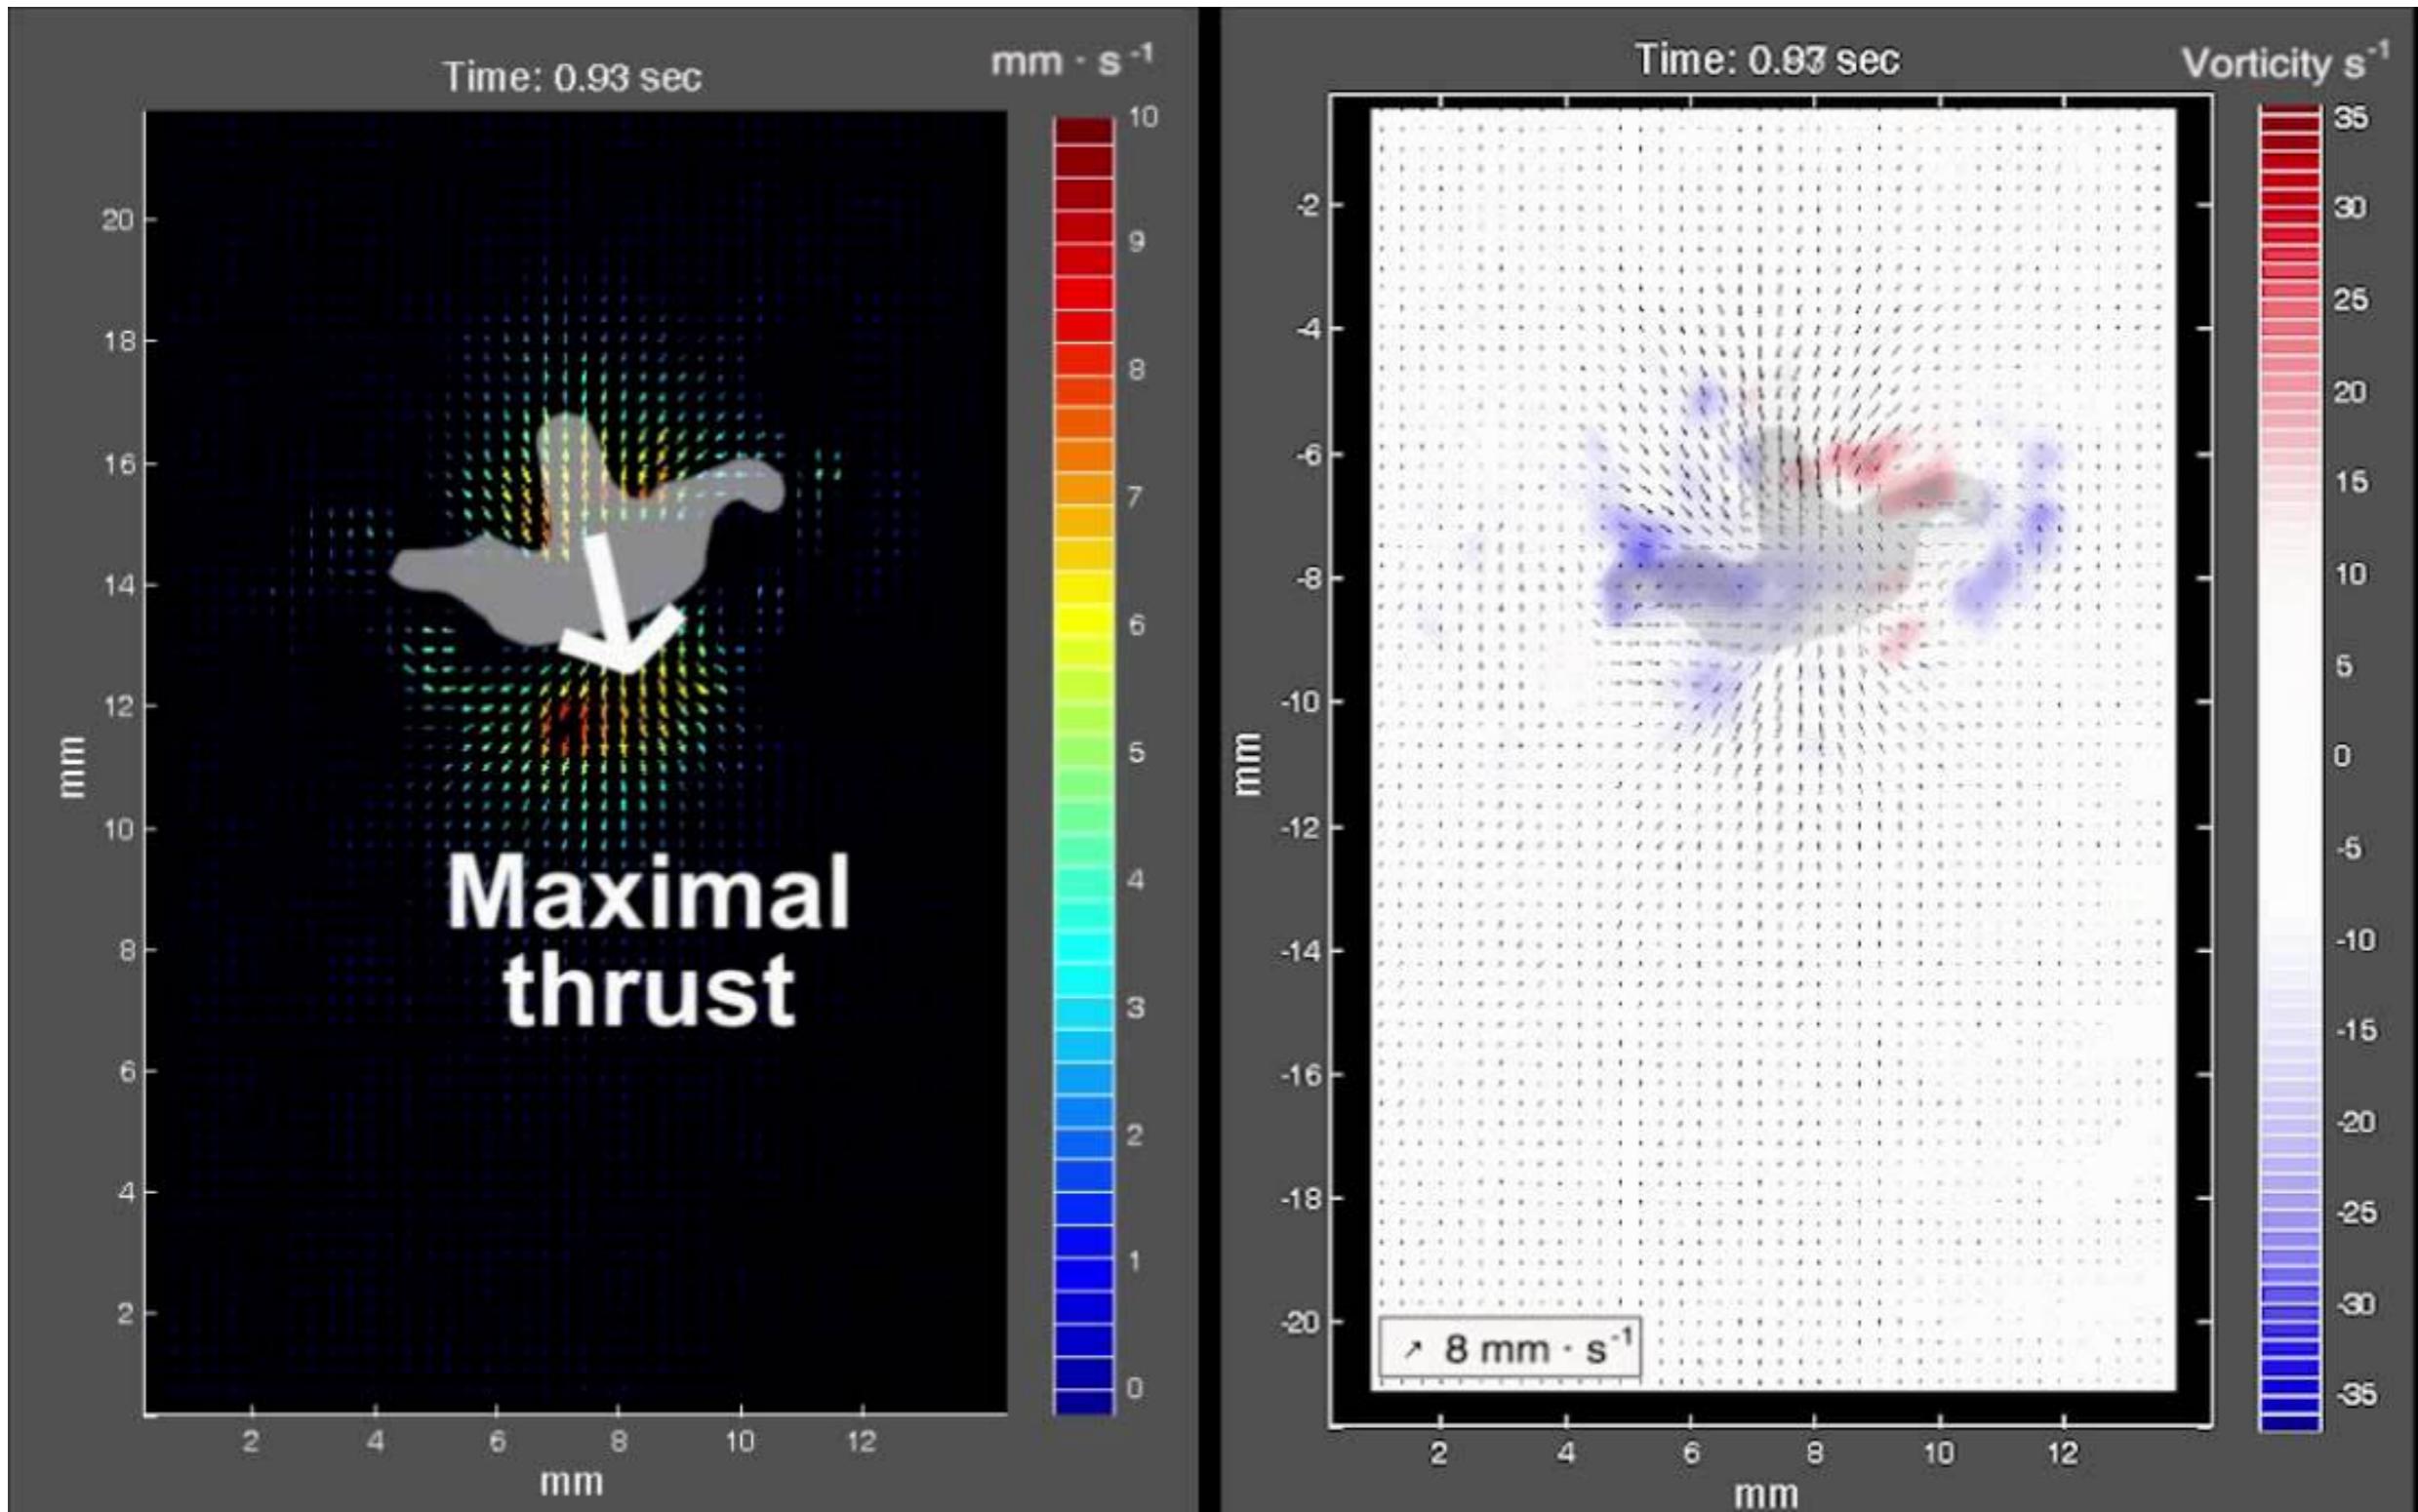

# PDE Applications:

## *Simulate Mixing on a Microfluidic Lab*

# PDE Applications: *Simulate how Jellyfish Move*

# PDE Applications:

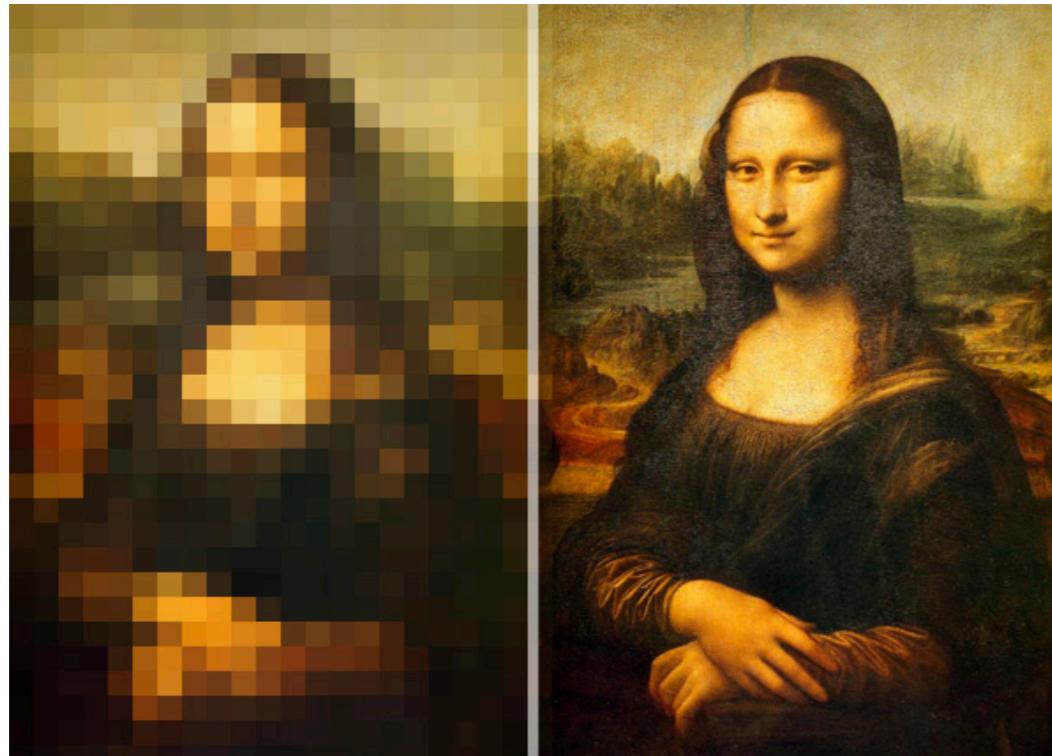

## *Simulate a Blood Flow in a Heart*

# Course Goals

1. Understand methods to simulate/solve ODEs and PDEs
2. Develop a strong mathematical understanding of error for these “numerical approximations”
3. Know how to balance approximation error and computational efficiency (accuracy vs. slow code)

high vs low resolution

approximation accuracy

$$e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} \dots = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

$$\sin(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}$$

$$\cos(x) = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}$$

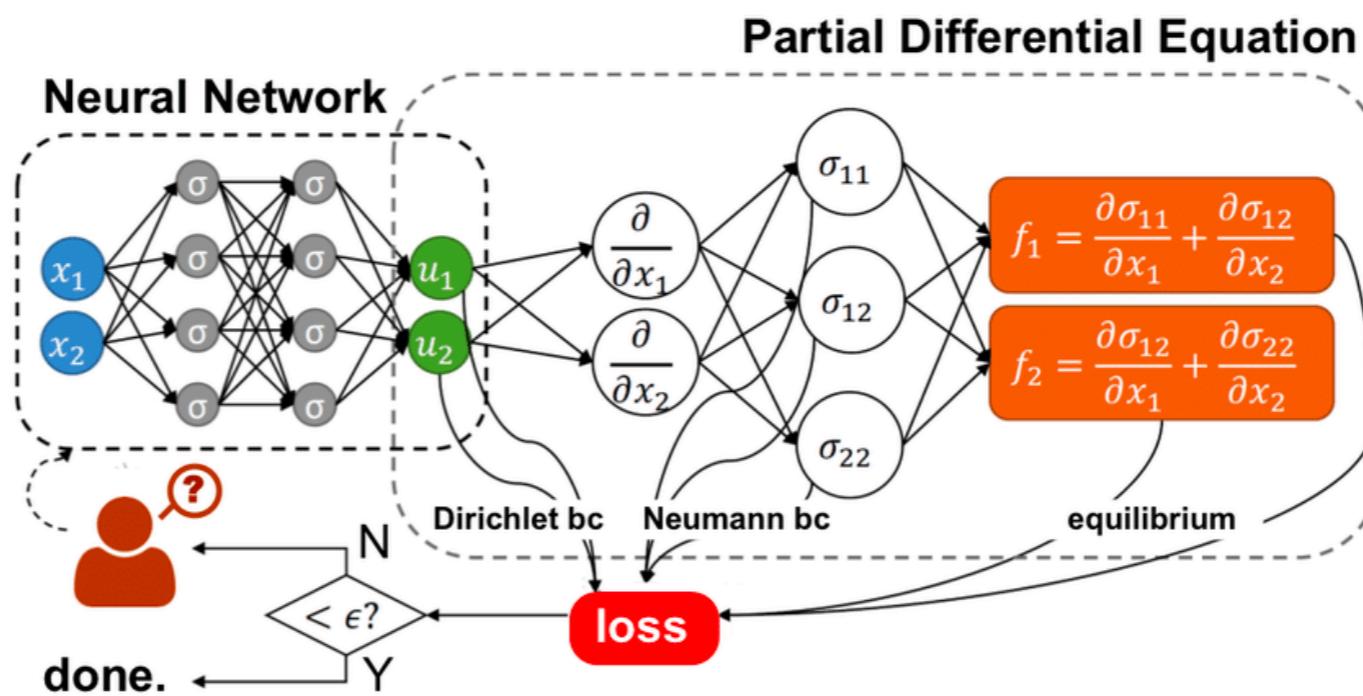

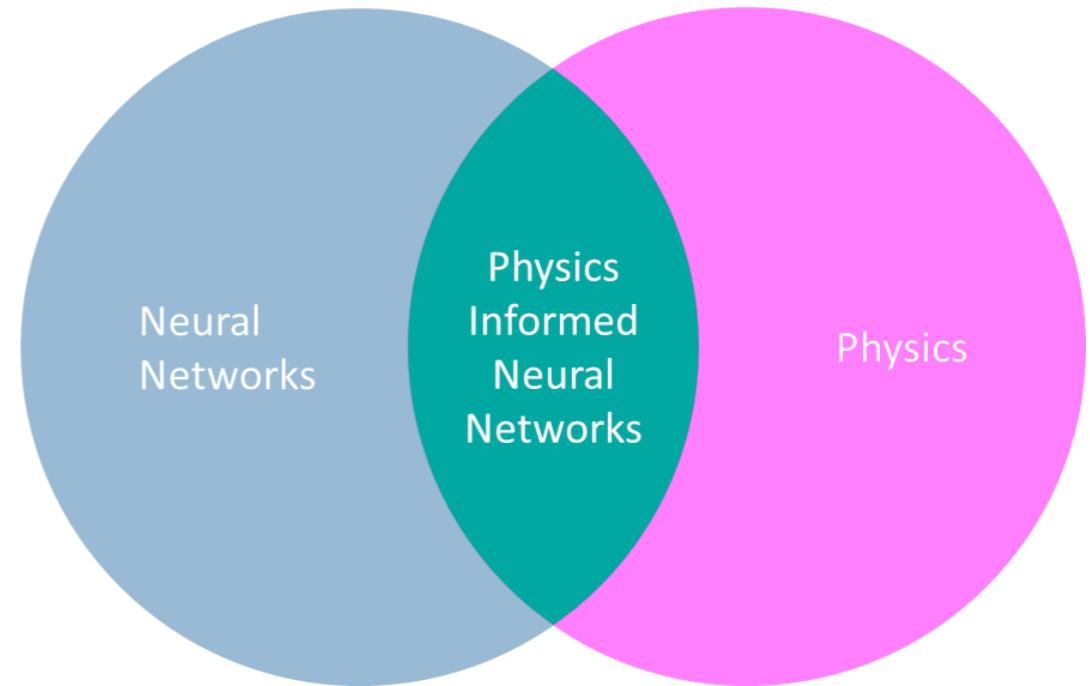

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \dots = \sum_{n=0}^{\infty} \frac{(-1)^n x^{n+1}}{n+1}$$

# Course Material Revisited

1. Ordinary Differential Equations (ODEs)  
solves for a scalar function  $f(t)$  using initial condition  
or a system, or set of equations:  $x(t)$ ,  $y(t)$ ,  $z(t)$
2. Boundary Value Problems (BVPs)  
incorporates information about  $f$  at/along a boundary
3. Numerical Linear Algebra (NLA)  
efficiently solves linear systems and computes spectral decompositions
4. Partial Ordinary Differential Equations (PDEs)  
solves a function defined over a D-dimensional space  $f(x,t)$  or  $f(x,y,z,t)$
5. *time permitting*: Other topics may include  
random processes and stochastic ODEs  
data-driven modeling of ODEs/PDEs

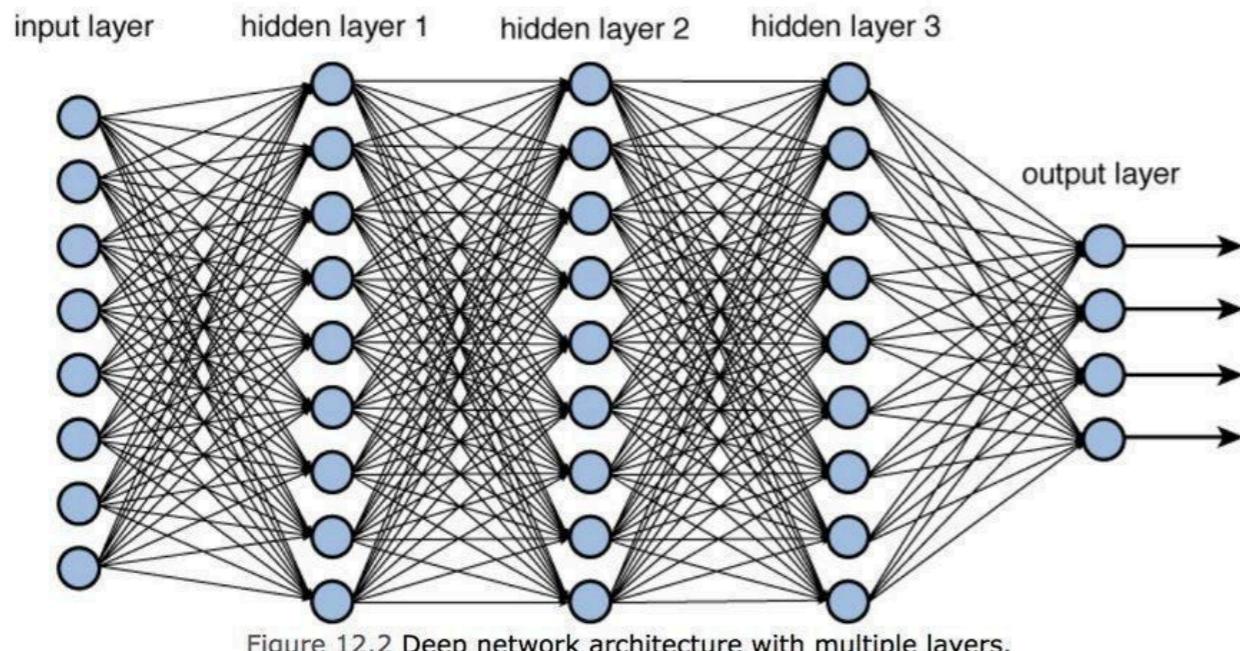

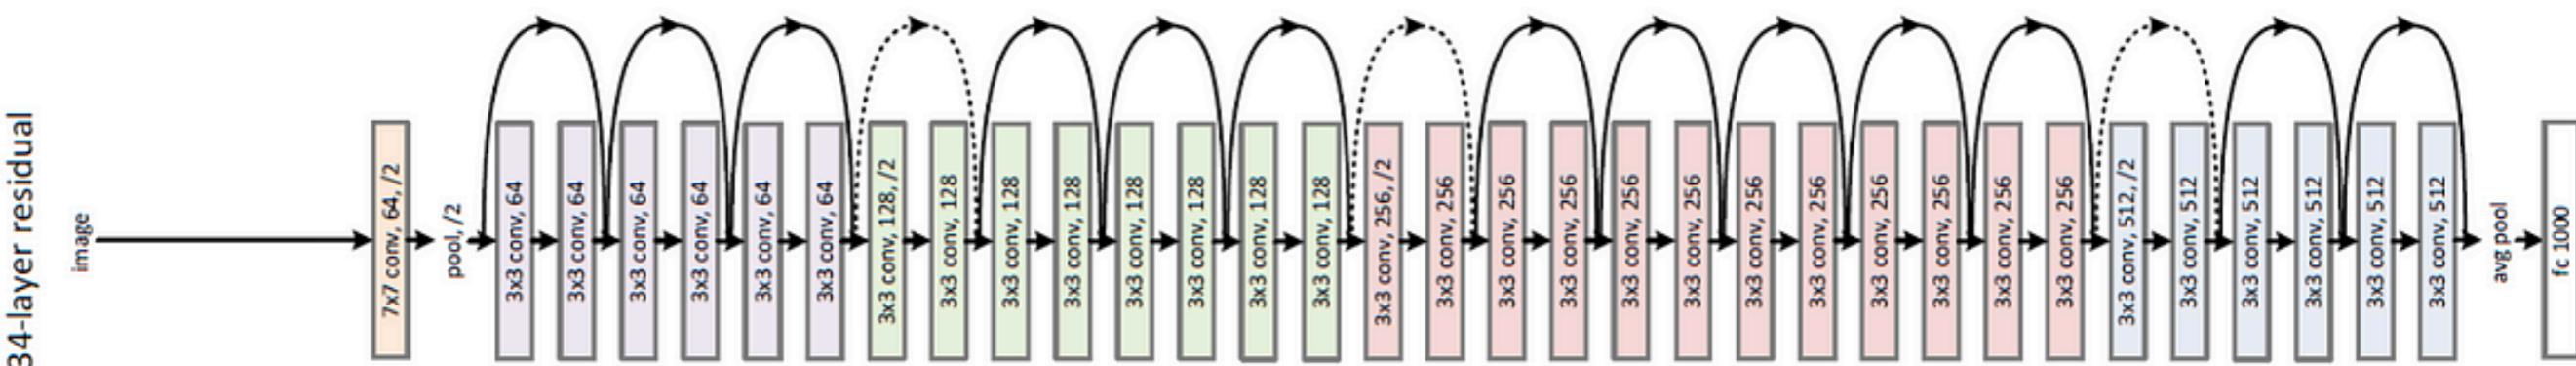

# Emerging Applications: *Learning Diff. Eqs. From Data*

- What if we have measured data but we don't know the differential equation?

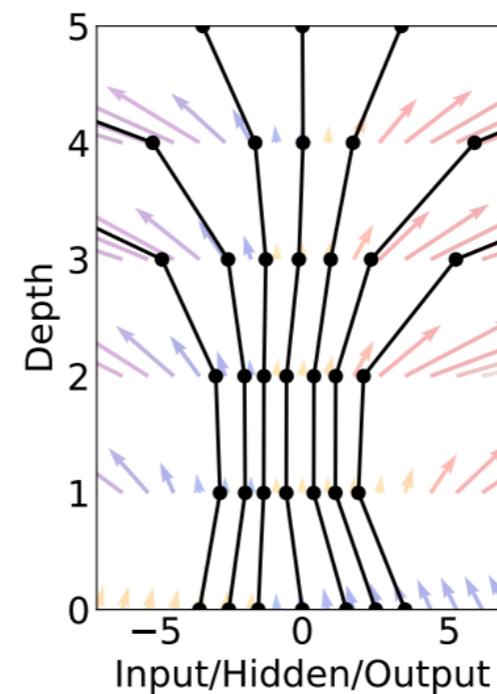

# Emerging Applications: Neural ODEs and PDEs

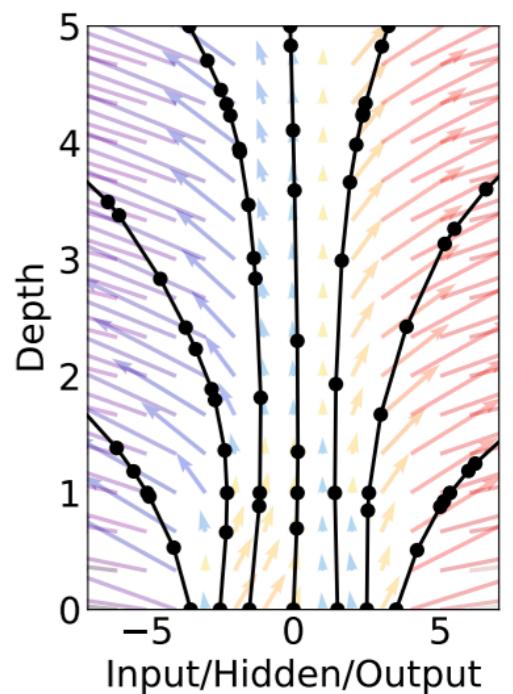

We can design neural networks to “look like” numerical solutions to differential equations

Residual Network

ODE Network

# Applications of ODEs
